QUICK BACK SYSTEM

SAFETY AND PROFITABILITY

Made to allow access between construction hoists and buildings, the Quickback System (QBS) is a temporary structure installed on a floor or a roof. Fraco's QBS offers many benefits; it provides safer construction site for workers and its simple components make the QBS the quickest system to install and dismantle. It allows labor savings up to 30%.

MODULAR DESIGN AND RELIABLE COMPONENTS

The QBS is a combination of landing floors made of aluminum ledger, landing beams and planks and plywoods. It also integrates modular system scaffold which includes vertical posts with rosettes and braces. The system can be easily adjusted to any landing level; a finer adjustment can be achieved by linking landing beam attachment to the rosettes. All parts are lightweight and can be installed without crane and supporting equipment. Thanks to the Fraco SBT (Safe Build Technology), a concept of notched slots and sliding spring pin latches that involves only linked pins. No loose parts, no tools are required so nothing can fall.
